Individual Water Supply - Coliform/E. Coli using Colilert

* When the laboratory report on the sample is positive for total coliform but negative for the presence of E. coli, the water supply in question shall be considered at risk for pathogenic contamination and shall again be physically inspected and necessary corrections made until subsequent samples are bacteriologically satisfactory. When the laboratory report on the sample is positive for both total coliform and E. coli, or the facility has failed to complete the water supply inspection within thirty days of the initial positive test result, the water supply is considered unsatisfactory. See Appendix G of the PMO.
